

Lab 1.0.1.2 - Draw Your Concept of the Internet

- Objectives

Networks are made of many different components

In this activity, you will visualize how you are connected, through the Internet, to those places, people, or businesses with whom (or which) you interact on a daily basis. After reflection and sketching your home's or school's topology, you can draw conclusions about the Internet that you may not have thought of prior to this activity.

1. After reviewing your classmate's drawings, were there computer devices that you could have included on your diagram? If so, which ones and why?

Answer: Yes, and they commonly included the server and the router, because both of them will also improve the efficiency and productivity. With a server, it's easier to roll out new software or make changes to every device on your company network. And managing security risks.

2. After reviewing your classmates' drawings, how were some of the model designs the same or different? What modifications would you make to your drawing after reviewing the other drawings?

Answer: We almost used the same devices or equipment but we have different concepts. After reviewing others' drawing, I would make my concept more alluring and understandable by any other individuals.

3. In what way could icons on a network drawing provide a streamlined thought process and facilitate your learning? Explain your answer.

Answer: I became more familiar about the flow of the internet and other devices or the equipment. And other things that related on the internet.
